```

Those are some pretty extreme variance reductions, considering we are conditioning 10K+ pars on 13 water levels and one flux. This is a well-known issue with low-rank ensemble method (“ensemble collapse”). This is over come with localization...

1.0.2 PESTPP-IES with simple temporal localization (and common sense)

Now let’s add some localization. The obvious stuff is temporal - scenario parameters can’t influence historic observations (and the inverse is true) so let’s tell PESTPP-IES about this. Also, should porosity be adjusted at all given the observations we have???

```
In [12]: par = pst.parameter_data
         #parameter groups for future recharge
         dont_groups = [g for g in pst.par_groups if "pr" in g]
         dont_groups.extend(["gr_rech3", "pp_rech1", "cn_rech5"])
         dont_groups = [g for g in dont_groups if g in pst.adj_par_groups]
         dont_pars = par.loc[par.pargp.apply(lambda x: x in dont_groups), "parname"].tolist()
         dont_pars.append("welflux_001")
         dont_groups.append("welflux_001")
         dont_groups
```

```
